

CONFERENCE CALL RECONNECT SYSTEM**ABSTRACT**

5 A method and implementing teleconferencing system for use
within voice and/or video teleconferencing arrangements,
includes means by which conference content is recorded and
subsequently made available to participants who may become
10 disconnected from the teleconference while it is still in
session. Upon reconnection to the teleconference, a
participant has an option to play back the missed portion of
the teleconference at various speeds until the recording has
become synchronized with the real time teleconference. The
participant may also choose to rejoin the real time
15 teleconference immediately upon reconnection and access the
missed but recorded portion of the teleconference at a later
time. In different embodiments, the call-back to a
disconnected participant and the recording of missed
teleconference content are accomplished either at the
20 telephone company or at a teleconference center.
